Cleaning
System

Works with all diesel,
gasoline, LPG, and natural
gas (CNG) engines

IMCS EVO

Intake Manifold Cleaning System

The new **IMCS EVO** (Intake Manifold Cleaning System) represents an evolutionary leap in intake system cleaning.

Compared to the previous model, which operated via vacuum suction, the new version introduces an innovative injection system that is more precise, direct, and highly effective.

Thanks to an integrated jaw-type injector system, the new cleaning fluid is injected directly into the intake manifold. This approach simplifies the connection process, significantly reducing intervention and suction times, enabling a targeted and powerful action with complete coverage of the parts to be treated. The injection allows precise control of the product flow, optimizing the amount of detergent used. Direct contact with carbon residues ensures a

deep and uniform cleaning. The action is faster, non-invasive, and does not require disassembly. Additionally, the system maintains all the distinctive features that set TREDLAB apart:

:

- Compatibility with **Oxy Hydro**;
- Prolonged cleaning effect;
- Intuitive control via **touchscreen**;
- Fully **automatic adjustment** of timing and fluid flow;
- Integrated database system with connection through the new **EASYPAB** app to view all **IMCS EVO** connection parameters.

The **fluid**, specifically formulated for the **IMCS Evo**, has remarkable capabilities to progressively clean and remove carbon deposits present in the intake manifold and along its entire path up to the combustion chamber.

Upon contact with the carbon, the fluid softens and removes it without causing detachment. Following the same principle, the cleaning cycle continues over the subsequent kilometers after the treatment.
